Security in Distributed Wireless Sensor Networks

Hon. Prof. Dr. Peter Langendörfer & Prof. Dr. Ing. Rolf Kraemer

- **Wireless Sensor Networks and Security**
- **Security Engineering**
- **Secure Sensor Node Architecture**
- **Conclusion**

Wireless Sensor Networks

Multihop Network

Clustered Network

- mesh router
- mesh client
- end node

BAN or PAN Network

- **Confidentiality**
Information should only be revealed to authorized entities; any other entity should not be able to discover the information from eavesdropping or from read in memory
- **Data Integrity**
The receiver of information wants to be sure that data is not modified in transit, either intentionally or be accident.
- **Accountability**
The entity requesting a service, triggering an action, or sending a packet must be uniquely identifiable
- **Availability**
Legitimate entities should be able to access a certain service/information and to enjoy proper operation
- **Controlled Access**
A service or information access should only be granted to authorized entities

Security features

- **Authentication (data and source authentication (data integrity))/non repudiation**
 - Does not help against insider attacks
 - Intrusion detection (identification of compromised nodes)
- **Secrecy**
 - Use of appropriate cipher means
- **Service Integrity**
 - Plausibility check of sensor readings
- **Availability**
 - Denial of service may cause serious harm
 - Graceful degradation needed

Basic Threads

- **Eavesdropping**
Listening to a communication to get unauthorized information
- **Masquerading**
Pretending to have another entity identifier
- **Authorization Violation**
Using services without being allowed to use them
- **Provoking loss or modification of information**
- **Forgery**
Creating new or false information
- **Repudiation**
Denial that one participated in or was the origin of communication
- **Sabotage**

Classification of Threats

- **Outsider attacks**
 - Eavesdropping
 - Jamming
 - Alter packets
 - Destroying nodes
- **Insider attacks (Compromised sensor nodes; laptops)**
 - Authorized participant
 - Steal secrets or disrupt normal functioning
- **Base station/cluster head as point of trust?**
 - Powerful device;
 - Tamperproof HW;
 - Scalability may become a serious problem
 - Battery power of nodes around the base station

Security Threat Analysis for sensor nodes

Dolev-Yao (known) :

**Extended Dolev-Yao:
(WSN relevant)**

Paradox

State of the art:

**Threat-Model with up to
5 years delay**

Options for security improvement:

Tamper-resistant nodes ($\Rightarrow$ too expensive)

“Probabilistic” security ($\Rightarrow$ attacker receives only limited gain)

Physical Attacks & Security

- **Device classes** (FIPS 140-02 level1-level4)
 - unprotected (L1 u. L2)
 - partly protected (L3)
 - tamper resistant (L4)
- **Attacker**
 - clever outsider (<5000 EUR)
 - “insufficient knowledge of the system”
 - knowledgeable insider (>5000 EUR)
 - “substantial technical education/experience”
 - funded organisation (several 100 KEUR)
 - “teams of specialists”

WSN Security Tomography

Real Life Connectivity

- Figures show WSN deployed on a flat parking lot
- Expected: simple, circular shape of “region of communication” – not realistic
- Instead:
 - Correlation between distance and loss rate is weak; iso-loss-lines are not circular but irregular
 - Asymmetric links are relatively frequent (up to 15%)
 - Significant short-term PER variations even for stationary nodes

Three regions of communication

- *Effective region:* **PER consistently < 10%**
- *Transitional region:* **anything in between, with large variation for nodes at same distance**
- *Poor region:* **PER well beyond 90%**

Open issues: Detection of compromised nodes

- **Secure routing protocols**
- **Secure & efficient time synchronisation**
- **Secure localization**
- **Efficient cipher means**
- **Secure misbehaviour detection**
- **Means for non security experts to design secure WSNs**

Security Engineering

Security Engineering in WSN

- **Limitations:**

Processing power :	8 or 16 bit μ C
Memory :	16 to 256 kByte
Energy resources :	typical small batteries 1000-5000 mAh energy harvesting
Active Time:	1-15 years
Cost :	1-100 \$
Security:	open to security critical

How to distribute secret keys in networks

- **Secure channel**
Pre-deployment
- **Third party**
security authority
Transitivity of trust (If node A and B trust C, C can generate key for A and B)
- **Public key based key establishment**
Computation of session key based on a unique public/private key pair
- **Key agreement based on one way functions**
Diffie-Hellman

Diffie-Hellman Key Establishment

- If we have a one-way-function:

$y = a \cdot x$, it is infeasible to compute a for given x and y

$a \cdot b \cdot x = b \cdot a \cdot x$ (commutative)

- Advantages:

Simple protocol

Key agreement of peers without prior knowledge

- Problems:

One-way-function (Elliptic curve cryptography, discrete logarithm) is computationally expensive

Authentication between Alice and Bob is not supported

Authentication: How to prove that Alice is Alice

- **By Third Party**
 - Security Authority
 - Transitivity of trust
- **By Secret keys**
 - Alice and Bob share a secret key
- **By Inverted hash key chains (e.g. TESLA)**
 - If $H(x)$ is a not-invertible hash function
 - Authentication with tuple $(x_n, H(x_{n+1}))$; trust anchor $H(X_n)$
 - x_n authenticates the one who sent $H(x_n)$ earlier
 - Problem:
 - lot of storage (for each communication previous hash keys)
 - initial trust (how can I authenticate the first message)
- **Signed certificates**
 - needs public key cryptography
 - Offline certification
 - Problem:
 - computational expensive

Combining Security & Embedded Systems Design

Setup of Hardware Repository

Applet Viewer: ckitgui.StartApplet.class

Applet

hardware setup software setup

**Structural view/
selection of
sub-components**

Name	SHT10
SensorTypeID	SENS00001
Description	Humidity accuracy: +-4.5%RH Temperature accuracy +-0.5°C
DataType	unit8
Unit	%RH / °C

TimeToSample	100	ms
EnergyConsumptionPerSample	100	nJ
SamplingRate	100	Hz

Parametrisation

```

?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE SensorType SYSTEM "sensor.dtd">

<SensorType>
  <Sensor>
    <Name>SHT10</Name>
    <SensorTypeID>SENS00001</SensorTypeID>
    <Description>Humidity accuracy: +-4.5%RH Temperature accuracy +-0.5°C</Description>
    <DataType>unit8</DataType>
    <Unit>%RH / °C</Unit>
  </Sensor>
  <SensorAttribute>
    <TimeToSample unit="ms">100</TimeToSample>
    <EnergyConsumptionPerSample unit="nJ">100</EnergyConsumptionPerSample>
    <SamplingRate unit="Hz">100</SamplingRate>
  </SensorAttribute>
</SensorType>

```

**Re-usable XML,
part of
hardware repository**

Applet started.

Setup of Software Repository

-structural view
-dependency graph
-selection of sub-components

The screenshot displays the 'Applet Viewer: ckltgui.StartApplet.class' window. The top section shows a dependency graph with nodes like 'Event Based', 'MW_interface', 'Middleware', 'tinyDSM', 'TinyPEDs', 'INA TestApp', 'optional Signature', 'Synchronisation', 'send funktion', 'GEOlocalisation', 'INA', 'Transport', 'Transport Protokoll', 'LibH', 'CDA', and 'GeoLo'. The bottom section is a configuration form for 'tinyDSM' with fields for Name, ModuleID, Description, Implementation, and size. It also includes a 'provides' section with a list of interfaces and a 'uses' section with a list of modules. A large green arrow points from the 'provides' section to the XML output on the right.

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE ModuleType SYSTEM "module.dtd">
<ModuleType>
  <Module>
    <Name>tinyDSM</Name>
    <ID>M006</ID>
    <Description>eventbased Middleware</Description>
  </Module>
  <ModuleAttribute>
    <Implementation>yes</Implementation>
    <Provides>
      <Provide>IF004</Provide>
    </Provides>
    <Uses>
      <Use>IF010</Use>
      <Use>IF009</Use>
      <Use>IF014</Use>
      <Use>IF012</Use>
    </Uses>
    <Is>
      <is>M024</is>
      <is>M025</is>
    </Is>
    <Size>
      <Size>9500</Size>
    </ModuleAttribute>
  </ModuleType>
```

Setting of parameters, dependencies, requirements

Re-usable XML, part of software repository

- Selection of hardware
- Selection of required functions
- Definition of security properties

- Each change of inputs immediately updates the result
→ Fast and easy refinement process

- Proposed software configuration
- Including prediction of footprint

Secure Sensor Node Architecture

Secure Sensor Node

ECC Processor B233: Optimized Version

Area consumption: optimized vs. original ECC Processor Version

Partial Multiplier	Length of Operand [bits]	Poly. Mult. Area [mm ²] optimized	Poly. Mult. area [mm ²] original Version
<i>2 segments</i>	<i>128</i>	<i>1.17</i>	<i>2.18</i>
<i>4 segments</i>	<i>64</i>	<i>0.62</i>	<i>1.51</i>
<i>8 segments</i>	<i>32</i>	<i>0.44</i>	<i>1.67</i>

Competitive Position: ECC

Company	Size K Gates	Energy mJ	Time/Op ms	Technology used
Elliptic Semi: B-233	71	0.14	6.68	0.13 μ m
IHP B-233	72-42	0.02-0.04	0.08-0.35	0.25 μ m
IBM B- 163+GF(p)	117	-	0.19	0.13 μ m
IHP B-163	47	0.01	0.06	0.25 μ m

Advantages of IHP:

- Minimal area consumption
- Iterative Karatsuba approach (patent filed)
- Flexible ECC Designs (patent filed)

AES

1. **Add key operation:** the incoming/outgoing data is “XORed” with the current round key
2. **SBOX:** The S-Box maps an 8-bit-input into an 8-bit-output.(result depends on the direction)
3. **Shift Row:** The shift row operation is performing a cyclic shift within a single row.
4. **Mix Column:** In the mix column operation each column is multiplied with a given polynomial

Competitive Position: AES

Company	Size Gates	Clock cycles per 128 Bit	Clock frequency	Throughput
Elliptic Semi: AES	8.000 +1.400 bit Memory	379	100 MHz	33,7 Mbit/s
IHP AES	8.450	70	66 MHz	108MBit/s
IAIK Graz	8.930	64	64 MHz	128MBit/s

Advantages of IHP:

- Integration with ECC
- Integration with protocols such as TCP
- Results equivalent to those of the Inventor of AES (Rijmen TU Graz)

Conclusions

Conclusions

- **Security in distributed systems is still a hot issue to solve**
- **Several approaches have been followed and have successfully been applied to several problem areas**
- **Distributed wireless sensor-networks are a special class of distributed systems that do not allow rigorous means to achieve security**
- **We have used a combined HW/SW approach to be able to make use of high grade encryption mechanisms like AES or ECC**
- **We have developed a security design environment that allows to engineer security in sensor-networks as required and achievable**
- **The results have been demonstrated and have been patented**

TANDEM: Power Switches
